

Exercise 9

Design input forms that validate data (e.g., email, phone number) and display error messages using HTML/CSS, JavaScript (with Validator.js)

Name : Praveen R

Register Number:230701244

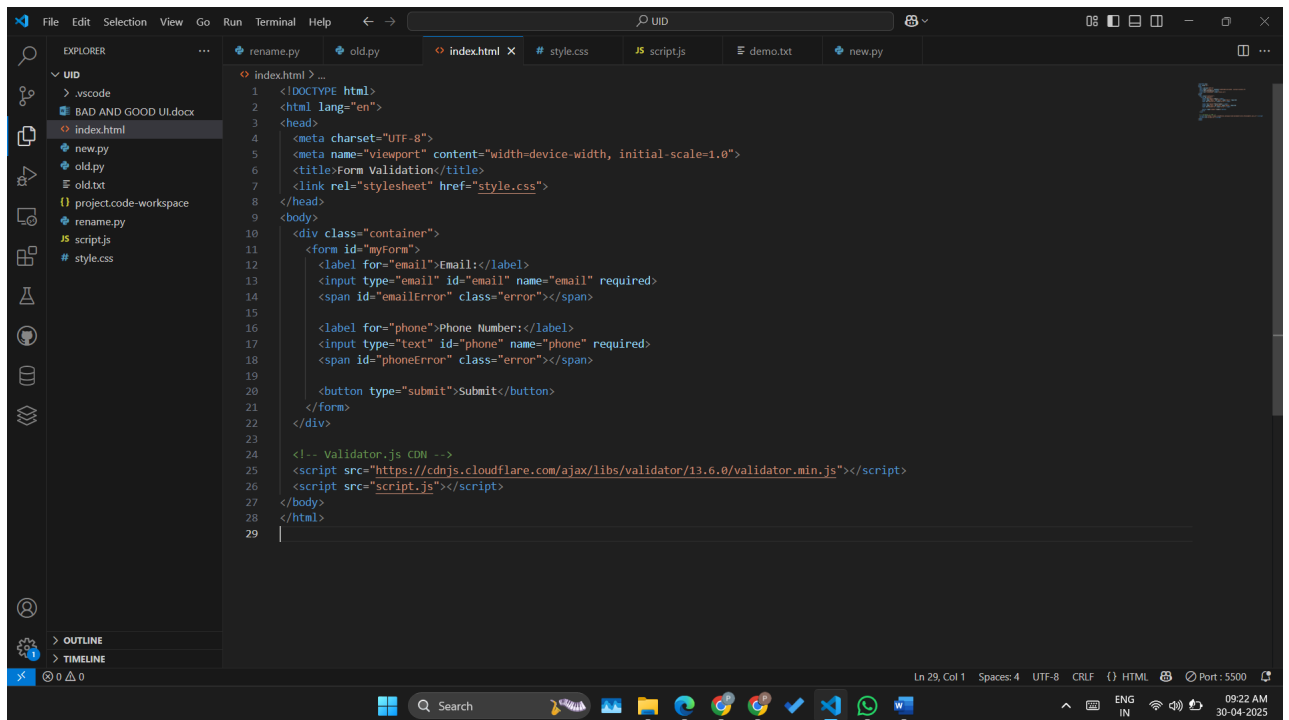

Aim

To create a form that checks if the user enters a valid email and phone number. If the data is wrong, it shows an error message using Validator.js.

Step-by-Step Procedure

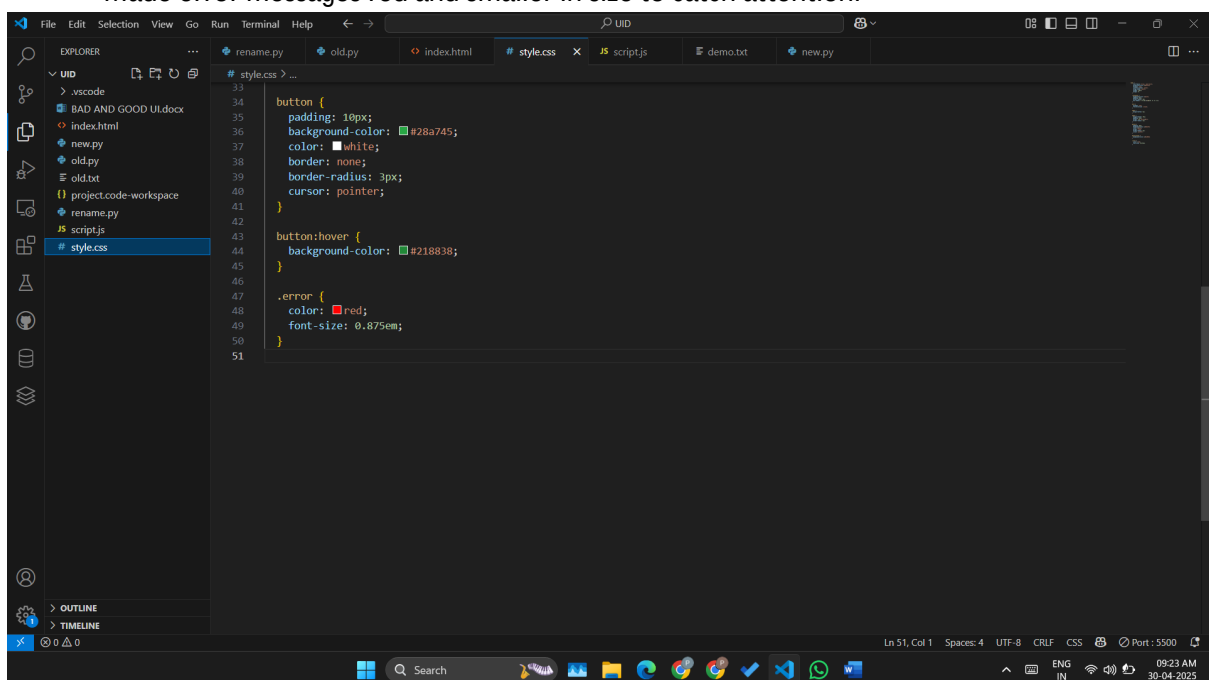

Step 1: Create the HTML Form

- Made a new HTML file (index.html).
- Added a form with two input fields:
 - One for **email**
 - One for **phone number**
- Added tags below each input to show error messages.
- Linked:
 - A **CSS file** (style.css) to style the form.
 - **Validator.js** using a CDN link to check if data is valid.
 - A **JavaScript file** (script.js) to add the validation logic.

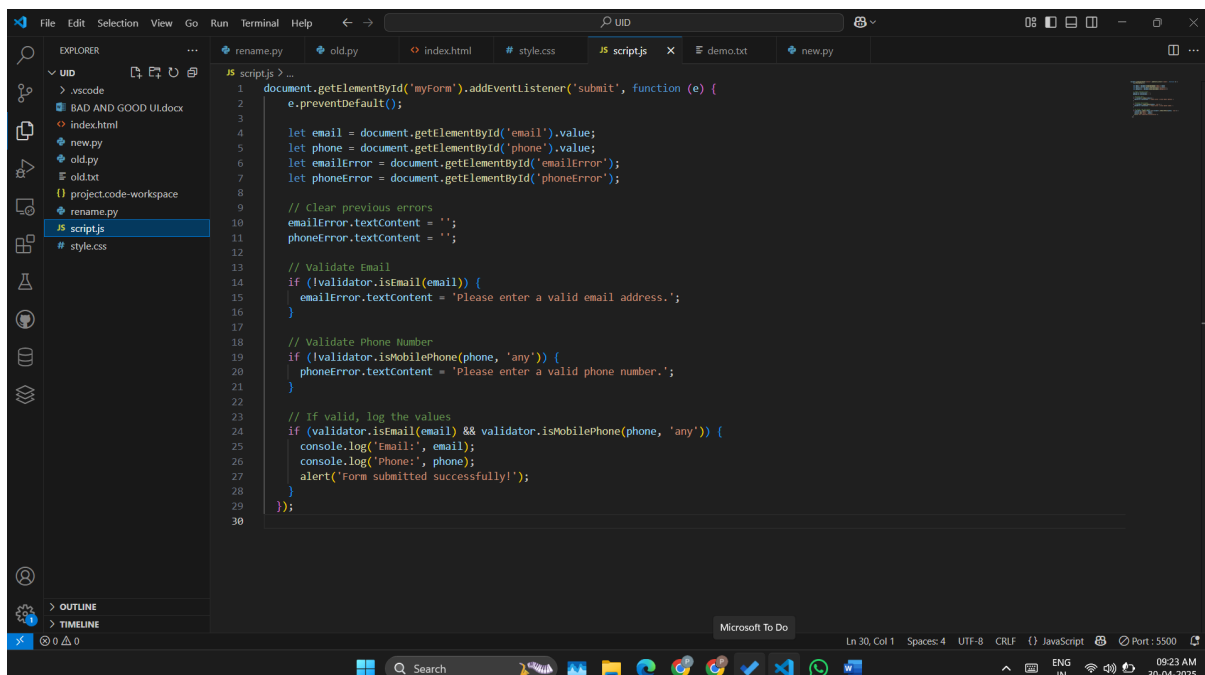

Step 2: Style the Form with CSS

- Created a CSS file (style.css) to improve how the form looks.
- Centered the form on the page and gave it:
 - A light background
 - Padding and borders
 - Clean spacing between inputs
- Styled the submit button with a green color and hover effect.
- Made error messages red and smaller in size to catch attention.

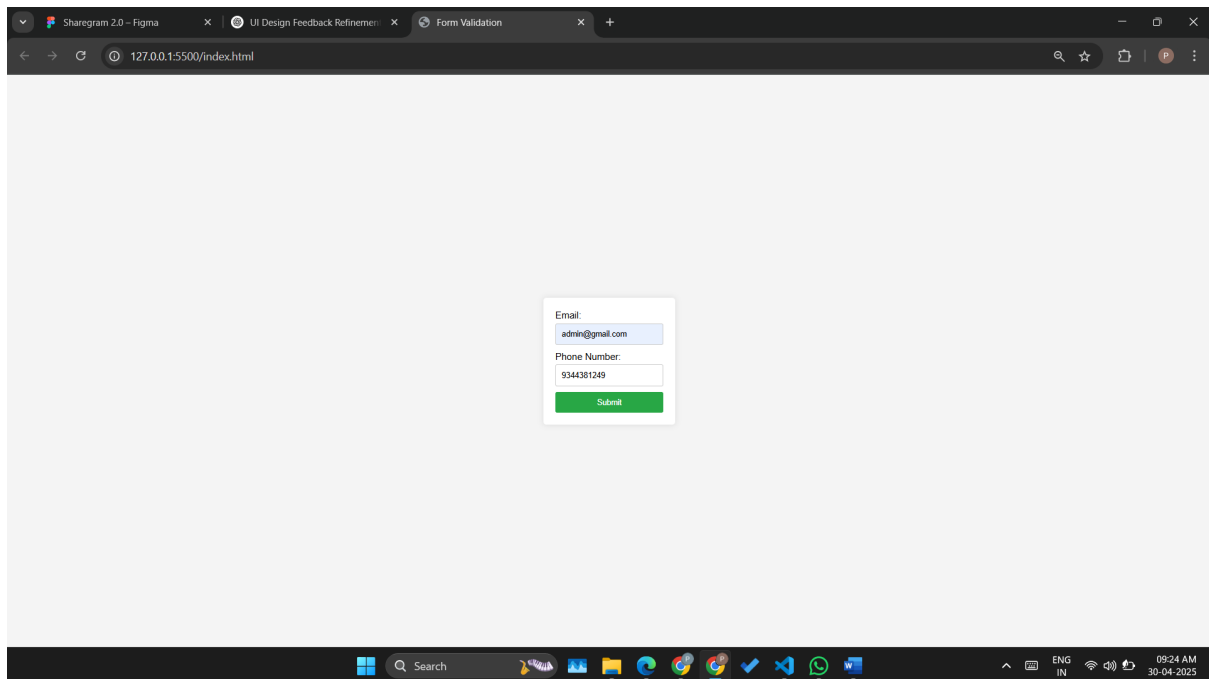

Step 3: Add JavaScript Validation with Validator.js

- Created a JavaScript file (script.js).
- Used addEventListener() to check the form when the submit button is clicked.
- Took the values from the email and phone fields.
- Used Validator.js to check:
 - If the email is correct
 - If the phone number is valid (from any country)
- If the input is wrong:
 - Show an error message below the field.
- If both are correct:
 - Print the values in the browser console.

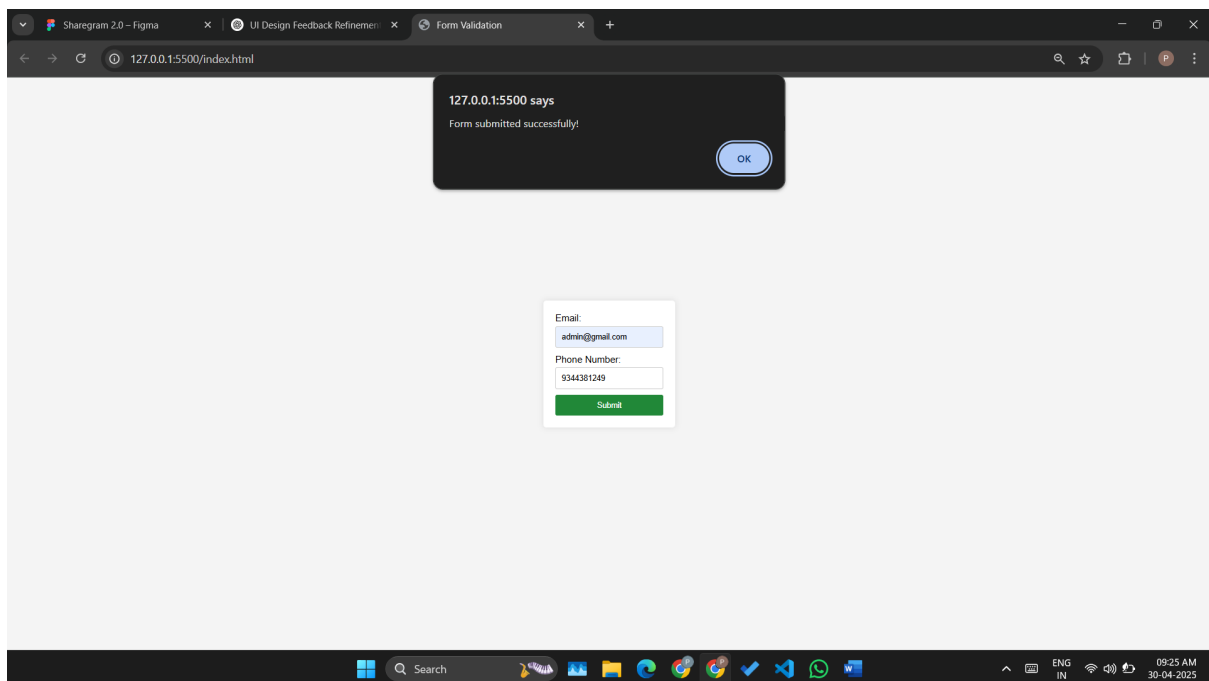

```
1 document.getElementById('myForm').addEventListener('submit', function (e) {
2   e.preventDefault();
3
4   let email = document.getElementById('email').value;
5   let phone = document.getElementById('phone').value;
6   let emailError = document.getElementById('emailError');
7   let phoneError = document.getElementById('phoneError');
8
9   // Clear previous errors
10  emailError.textContent = '';
11  phoneError.textContent = '';
12
13  // Validate Email
14  if (!validator.isEmail(email)) {
15    emailError.textContent = 'Please enter a valid email address.';
16  }
17
18  // Validate Phone Number
19  if (!validator.isMobilePhone(phone, 'any')) {
20    phoneError.textContent = 'Please enter a valid phone number.';
21  }
22
23  // If valid, log the values
24  if (validator.isEmail(email) && validator.isMobilePhone(phone, 'any')) {
25    console.log('Email:', email);
26    console.log('Phone:', phone);
27    alert('Form submitted successfully!');
28  }
29 });
30
```

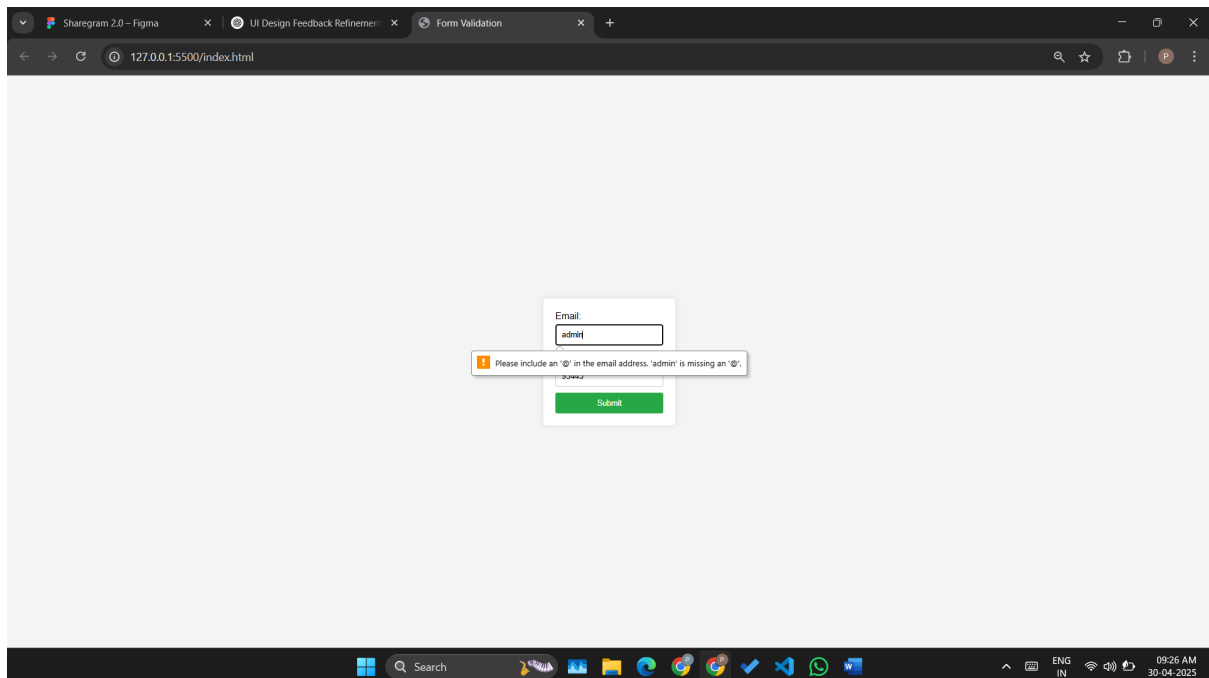

Output

Success message :

Error message:

- When user types wrong email or phone, error messages are shown.
- When user types valid input, the values are accepted and shown in the console.
